Primary Research Foci

- **Effects of Habitat Disturbance on Physiological Health and Behaviour of Primates: Implications for Socioecology and Conservation.** I use observational techniques, physiologic health assessments, nutritional analyses of foods, endoparasite assessments and endocrinology to investigate mechanisms through which forest fragmentation and disturbance affect the ecology, behavior, mobility and health of wild primates. These data can provide good tests for socioecological theory (i.e., effects of resource density and patchiness), as well as improving conservation planning. Currently efforts focus on nutritional ecology and parasitology.
- **Effects of Habitat Disturbance on Lemur Community Ecology.** I use census methods and population ecology to examine changes in species richness and abundance across habitat disturbance and fragmentation gradients.
